Detailed Solutions and Explanations

Providing detailed solutions to the exercises on page 168 can significantly aid students in their comprehension of the material. Here, we will break down the process of solving typical problems found on this page.

Example Problem Breakdown

Consider a sample problem that asks students to solve a linear equation:

Example: Solve for x in the equation $3x + 5 = 20$.

To solve this, students should follow these steps:

1. Subtract 5 from both sides: $3x = 15$.
2. Divide both sides by 3: $x = 5$.

This systematic approach helps students understand the logic behind each step, reinforcing their problem-solving skills.
