Common Four-Letter Biology Terms

A variety of four-letter words are commonly used in biology, each with its distinct meaning and application. Below is a selection of notable terms, accompanied by their definitions:

- **Cell** - The basic structural and functional unit of all living organisms.
- **Gene** - A unit of heredity that is transferred from a parent to offspring, determining some characteristic of the offspring.
- **Bond** - A lasting attraction between atoms that enables the formation of chemical compounds.
- **Herd** - A group of animals, particularly those of the same species, that live and feed together.
- **Fung** - A kingdom of organisms that includes yeasts, molds, and mushrooms, which are distinct from animals and plants.
- **Alga** - A simple non-flowering plant of a large group that includes the seaweeds and many single-celled forms.
- **Path** - Short for pathogen, referring to an organism that causes disease.
- **Skin** - The outer covering of the body of an animal, which serves as a barrier and protective layer.
