The program typically requires coursework in both core biology subjects and specialized areas. The following sections outline the key components of the biology curriculum.

Core Courses

The core courses are essential for all biology majors and cover fundamental topics that provide a foundation for advanced study. Key core courses include:

- **General Biology:** An introduction to the principles of biology, including cell biology, genetics, evolution, and ecology.
- **Biochemistry:** A study of the chemical processes within and related to living organisms.
- **Genetics:** An exploration of heredity, gene structure, and function.
- **Ecology:** Understanding the interactions between organisms and their environment.
- **Evolution:** A study of the processes that drive the diversity of life on Earth.

These core courses are complemented by laboratory experiences that allow students to apply theoretical concepts in practical settings, enhancing their understanding and skills.

Electives and Concentrations

In addition to core courses, students can select elective courses that align with their interests and career goals. The biology department offers various concentrations, including:

- **Cellular and Molecular Biology:** Focuses on the structure and function of cells and molecules.

- Ecology and Evolutionary Biology: Emphasizes ecological principles and the evolutionary processes that shape biodiversity.
- Organismal Biology: Studies the biology of individual organisms, including anatomy and physiology.

Students can also choose electives that cover specialized topics such as microbiology, marine biology, and plant biology, allowing for a well-rounded education.
