Analysis of the 2009 AP Calculus BC FRQs

Question 1: Parametric Equations

The first question of the 2009 AP Calculus BC exam involved parametric equations. Students were required to analyze the motion of a particle moving in the plane defined by specific parametric equations.

To solve this problem, students needed to:

1. Find the velocity vector.
2. Determine the acceleration vector.
3. Analyze the motion at a given point in time.

This question tested students' abilities to differentiate parametric equations and understand the physical implications of velocity and acceleration.

Question 2: Series Convergence

The second question focused on the convergence of a series. Students were tasked with determining whether a given series converged or diverged, employing various convergence tests such as the ratio test or the integral test.

Key steps included:

1. Identifying the appropriate test for convergence.
2. Justifying each step of the solution clearly.
3. Providing a concise conclusion about the series' behavior.

This question highlighted the importance of depth in understanding infinite series.

Questions 3 to 6: Diverse Topics

The remaining questions covered a variety of topics, including differential equations, the Fundamental Theorem of Calculus, and applications of integrals. These questions required students to demonstrate a wide-ranging knowledge of calculus principles.

Students tackled challenges such as:

- Finding particular solutions to differential equations.
- Evaluating definite integrals using properties of functions.
- Applying calculus concepts to solve real-world problems.

Each of these questions contributed to a well-rounded assessment of the students' calculus abilities.
