How Sonic Calculus Technology Works

The sonic calculus teeth plaque remover employs high-frequency vibrations that create rapid movements, which help dislodge and remove plaque from the surface of the teeth. Unlike traditional manual brushing, which relies solely on physical scrubbing, this device utilizes sonic waves to enhance the cleaning process.

These sonic vibrations can reach deep into the crevices of the teeth and gums, where traditional brushes may struggle. The technology works by creating bubbles in the saliva through cavitation, which effectively disrupts the plaque and calculus buildup without harming the enamel. This method is not only more efficient but also reduces the risk of gum irritation compared to manual tools.
