Historical Evolution of Modern Chemistry

The evolution of modern chemistry can be traced back to the transformation of alchemical practices into a systematic scientific discipline. The 17th and 18th centuries marked significant milestones as scientists like Robert Boyle and Antoine Lavoisier laid the groundwork for modern chemical theory. Boyle's law, which describes the inverse relationship between the pressure and volume of a gas, introduced empirical methods that became foundational in experimental chemistry.

In the late 18th century, Lavoisier's work on combustion and the law of conservation of mass established a new understanding of chemical reactions. He is often referred to as the "Father of Modern Chemistry" for his systematic approach to chemical nomenclature and his role in debunking the phlogiston theory. This era also saw the development of the periodic table, with Dmitri Mendeleev's 1869 formulation organizing elements based on their atomic weights and properties, paving the way for the discovery of new

elements and the understanding of chemical behavior.
