Structure and Properties of Ammonium Ion

The ammonium ion (NH_4^+) is a positively charged polyatomic ion formed from the protonation of ammonia (NH_3). It consists of a nitrogen atom surrounded by four hydrogen atoms, creating a tetrahedral molecular geometry. This arrangement leads to a bond angle of approximately 109.5 degrees, typical of sp^3 hybridization.

In terms of physical properties, ammonium compounds are generally white crystalline solids that are highly soluble in water. The ionic nature of NH_4^+ contributes to its strong interactions with water molecules, making it an essential component in various aqueous solutions. The ammonium ion exhibits a
