Supply and Demand

Supply and demand are the bedrock of economic activity. Supply refers to the quantity of a good or service that producers are willing to sell at various prices, while demand denotes the quantity that consumers are willing to purchase. The interaction between these two forces determines market prices and availability. By understanding these dynamics, individuals can make better purchasing decisions, timing their buys to coincide with lower prices.

Opportunity Cost

Opportunity cost is another essential economic concept that refers to the value of the next best alternative that is foregone when making a decision. Recognizing opportunity costs can aid individuals in assessing trade-offs in their personal and professional choices, thus leading to more informed and beneficial decisions.
