By focusing on the relationship between environmental stimuli and responses, behavioral psychology aims to identify patterns that can be modified for better mental health outcomes.

The Foundations of Behavioral Psychology

At its core, behavioral psychology operates on several key principles. These include:

- **Conditioning:** This is the process through which behaviors are learned. Classical and operant conditioning are two major types that illustrate how behaviors can be shaped by reinforcement and punishment.
- **Reinforcement:** Positive or negative reinforcement increases the likelihood of a behavior being repeated, while punishment aims to decrease it.
