Common Misconceptions about Metabolism

There are several misconceptions surrounding metabolism that can lead to confusion about metabolic health.

Myth 1: Metabolism is Fixed

Many believe that metabolism is a fixed trait determined solely by genetics. However,

lifestyle factors such as diet and exercise significantly influence metabolic rates.

Myth 2: All Calories are Equal

Another common misconception is that all calories have the same effect on the body. In reality, the source of calories matters. Nutrient-dense foods positively impact metabolism more than empty-calorie foods.

Myth 3: You Can't Change Your Metabolism
